

NOHA Dashboard — Your Handbook

A companion to the **NOHA Operating Manual** (May–August 2026 cycle). The Manual tells you *what* to do and *why*. This handbook tells you *how* to do it inside the dashboard, page by page, plus things you can tweak, add, and watch out for.

If you're reading this, the dashboard is already running locally at <http://localhost:5173>. If something's broken before you even get started, skip to Section 11 — Troubleshooting.

1. Welcome

You're sitting at the centre of XEM's digital engine. The Operating Manual defines your role; this dashboard operationalises it. Everything the Manual says you should track (registrations, content cadence, paid spend, the Friday report, the briefs to Leo and Juan) lives here so you don't have to juggle spreadsheets and sticky notes for 13 weeks.

The dashboard is built around one principle from the Manual:

"Your role demands tool fluency. The right tool stack lets one person manage five platforms; the wrong stack means you'll spend more time switching between tabs than producing content." — Section 5

This is that stack — in one tab.

2. Quick orientation

The left sidebar has eight items. Here's the mental model for when to use each:

Sidebar item	Use it when
Dashboard	Every time you open the app. Glance at phase, progress, today's tasks, overdue work.
Tasks	When you want to check things off, see the full Today / Upcoming / Overdue / Phase view, or plan the day.
Content Calendar	Monday morning — to plan the week. Tuesday — to track Canva production. Friday — to confirm what posted.
Metrics	Mid-week to log post performance. Wednesday for the GA4 deep-dive. Friday morning to lock down weekly numbers before the report.
Friday Report	Friday morning to draft. Friday before 4 PM WAT to submit and export.
Creative Brief	Monday morning when you need design from Leo — never the other way around.
Paid Ad Brief	Before any paid spend. Required before launching; must be MD-approved above ₦150k/week.
Broadcast Brief	Monday to brief Juan on the week's WhatsApp + SMS broadcasts.

💡 On mobile, the sidebar is hidden — tap the ☰ hamburger top-left of the page to slide it in.

3. Your weekly rhythm with the dashboard

The Manual prescribes a weekly rhythm. Here's the exact button-by-button version inside the dashboard.

Monday — 60–90 minutes total

1. Open the **Dashboard**. Note the cumulative registration number and whether the gold progress bar is **ahead, on, or behind** the next milestone.
2. Go to **Metrics → Registrations & GA4**. Click the row for *last* week's Friday in the bottom table — the form prefills with last week's data so you can confirm the previous week's totals are final.
3. Go to **Content Calendar**. Click "**Jump to this week**" if you're not already there. Fill in 1–3 *hero posts* for the week, then the supporting daily content. Tick "**Needs design from Leo**" on cells that need creative.
4. Go to **Creative Brief**. For each "Needs design from Leo" cell from step 3, create a brief (one per design need). Save → **Download .md** → send to Leo via your preferred channel.
5. Go to **Broadcast Brief**. Click "**This week**". Add 1–3 broadcasts for the week. Save → **Download .md** → send to Juan.
6. Optionally open **Tasks** and check off "Monday content calendar build" once you're done.

Tuesday — 60–90 minutes total

1. **Canva production day**. No specific dashboard module — produce visuals in Canva for the week's content.
2. Schedule the week's content in Buffer/Hootsuite.
3. Open **Content Calendar** — mark each cell "**Scheduled**" as you schedule it. Status pills will go from grey (Draft) to blue (Scheduled).
4. Check off the **Tuesday Canva production** task in Tasks.

Wednesday — 30 minutes

1. Open **Metrics → Registrations & GA4**. Log Wednesday's running numbers — page visits, conversion rate, top traffic source from GA4.
2. Open **Metrics → Platforms**. Update mid-week impressions/follower counts for each platform.
3. If something is off-target (e.g., LinkedIn isn't converting), flag it mentally — you have 2 days to adjust before Friday's report.
4. Check off **Wednesday GA4 deep-dive** in Tasks.

Thursday — minimal

- Engagement only (the 11 AM and 4 PM blocks).
- Update Content Calendar entries to "**Posted**" as posts go live.

Friday — the most important day

1. **By 1 PM WAT** — finish all platform metric entries for the week in **Metrics → Platforms**. This is what the report auto-pulls. (You'll get a push reminder at exactly 1 PM if push is enabled.)

2. **Open Friday Report.** Click "**This week**" if needed. Glance at the auto-filled numbers in the top summary box — that's what the MD will see.
3. **Fill in the free-text sections:**
 - **Headline** — one sentence: "Above target by X, driven by Y."
 - **Wins** — 2–3 specific things, with the metric proving each.
 - **Blockers** — each must include your proposed resolution.
 - **Next week priorities** — maximum 3, concrete.
 - **China programmes** — what's live this week for each programme.
 - **Requests of leadership** — specific asks, named, with deadlines.
4. **Watch the Markdown preview** on the right — that's what gets sent.
5. **Save draft** any time. **Submit** before 4 PM WAT.
6. Click **Download .md**. Attach the file to your email/message to MD + Mary. (Or **Copy Markdown** and paste into Slack/Notion.)

Daily — every weekday

- **11 AM and 4 PM** — engagement windows. Reply to comments/DMs in Buffer or natively. Check off the task in Tasks once done.
- **5 PM** — end-of-day review. Quick scan of tomorrow's first task and what got scheduled.

4. Module-by-module guide

4.1 Dashboard (the home page)

Composed of four sections:

1. **Push permission banner** (gold, top) — only appears if you haven't enabled browser notifications yet. Tap "**Enable notifications**" to subscribe; tap "**Not now**" to hide it for 24 hours.
2. **Phase Tracker** — banner showing the current phase + a card for each of the four phases (Awareness, Conversion, Urgency, Post-event). The active phase has a blue ring and a "Day N of M" progress bar at the bottom.
3. **NPS Progress** — the 200-target ladder with milestone dots at 20, 80, 160, 200. Gold dots = milestones already hit. Blue-to-gold bar fills as registrations come in.
4. **Today / Overdue** — two side-by-side panels. Click the checkbox to complete; click again to undo. **Skip** button on the right marks "intentionally not done" (different from overdue).

4.2 Tasks

Four tabs: **Today | Upcoming | Overdue | Phase milestones**. Each tab has a count badge — Overdue badge turns red when there's anything to chase.

Every row has:

- **Checkbox** (far left) — click to mark done. Once done, the title goes grey and gets a strikethrough, the box fills green with ✓, and the row dims.
- **Title + description** — the task and what to do.
- **Category pill** — Production, Engagement, Phase milestone, etc.
- **WAT time pill** — when the occurrence is scheduled.

- **"Overdue" red pill** — appears on rows past their time, not yet done.
- **Skip button** (far right) — only when not yet done.

The seeded tasks (already in your database):

- **Daily** — 11 AM engagement, 4 PM engagement, 5 PM end-of-day review.
- **Weekly** — Mon 8 AM calendar build, Tue 9 AM Canva production, Wed 9 AM GA4 deep-dive, Fri 9 AM morning production, Fri 1 PM report warning, Fri 4 PM report submit.
- **Phase milestones** — Phase 2 launch (8 Jun), Meta Pixel install (12 Jun), Techno Summer landing page (15 Jun), NPS Day 1 (15 Jul), NPS Day 2 (16 Jul).

4.3 Content Calendar

Weekly Mon–Fri × 5-platform grid. Click any cell to open the edit dialog. Fields:

- **Topic** — what the post is about.
- **Format** — carousel, long-form, thread, video, etc.
- **Status** — Draft → Scheduled → Posted (or Cancelled).
- **Needs design from Leo?** — tick this if Leo needs to produce artwork, then briefly note what's needed (use Creative Brief for the full structured version).
- **Buffer link** — paste the Buffer scheduled-post URL if you want to jump back to it.
- **Notes** — anything else.

The header bar tells you how many entries you've planned this week and how many need Leo's design.

 The cell colours are deliberate: grey = Draft, blue = Scheduled, green = Posted, red strikethrough = Cancelled. You can scan the whole grid in 2 seconds and know what's outstanding.

4.4 Metrics

Three tabs at the top.

Platforms — weekly grid of 5 platforms × 4 metrics (Posts, Impressions, New followers, Engagement %). **Edit on blur** — type a number, click away, it saves. No save button to remember.

Paid campaigns — list of all paid campaigns, with status pills (Draft, Pending approval, Approved, Live, Paused, Killed, Completed). Click "+ **New campaign**" to create one. Click "**Daily metrics**" on a row to add daily spend/registrations/clicks/impressions — the dashboard computes cost-per-registration automatically.

Registrations & GA4 — daily form to log:

- Cumulative registrations (auto-prefills from last entry).
- New today.
- Page visits (from GA4).
- Conversion rate (from GA4).
- Top traffic source / worst performing.

The progress bar at the very top of the Metrics page always shows current cumulative vs. 200 target, with milestone dots.

4.5 Friday Report

Split view: editor on the left, live Markdown preview on the right (or stacked vertically on mobile). The right pane is what gets sent.

The summary box at the top of the editor pulls all your weekly metrics automatically — you don't enter them again. You only edit the free-text sections: Headline, Wins, Blockers, Next-week priorities, China programmes, Requests of leadership.

Three export options:

- **Save draft** — saves your editing progress (status stays "Draft").
- **Mark as submitted** — flips status to "Submitted" and records the timestamp. Visible as a green pill at the top.
- **Download .md** — produces a clean Markdown file that renders identically in GitHub, Obsidian, and any standard viewer.
- **Copy Markdown** — copies the same content to clipboard for pasting into Slack, WhatsApp, Notion, etc.

💡 The Markdown export uses a GFM table for the Platform breakdown. When pasted into Slack the table renders as plain text; in Notion it renders as an actual table; in GitHub it's a proper table. Choose your channel accordingly.

4.6 Creative Brief (Appendix B — for Leo)

Top bar: a dropdown of saved briefs + "**+ New**" + Save/Copy/Download buttons. Picking a saved brief loads it into the form. Saving creates a new entry the first time, updates after.

Form mirrors the Manual's Appendix B exactly:

- Project title, recipient (defaults to Leo).
- **Deliverables** — one per line (each line becomes a bullet in the exported brief). Examples in the placeholder.
- **Platforms** — click to toggle pills.
- Campaign / phase + duration of use.
- Audience + core message.
- **Mandatory elements** — checkboxes for XEM logo, NPS branding, event date, venue, registration URL + free-text "Other".
- Mood/tone (three words) + reference links.
- Constraints (other than brand colours, which are added automatically).
- First draft date + final delivery date.

💡 The mood/tone field is the highest-leverage one. "Authoritative, warm, considered" gets a completely different deliverable from "Bold, energetic, modern" — even with identical other fields.

4.7 Paid Ad Brief (Appendix C — for MD approval)

Highlighted "**Approved by MD**" checkbox at the top. The Manual is strict: never launch without explicit MD sign-off above ₦150k/week, and *never* without a written brief.

Sections, top to bottom:

- Identity (campaign name, platform: LinkedIn / Meta / Both).

- Campaign objective + target registrations + max acceptable cost/reg.
- Target audience (job titles, seniority, industries, geography, company size, estimated audience size, exclusions).
- Budget & duration (total, daily, start, end, 72-hour checkpoint).
- Creative direction.
- **Copy variants** — accordion cards for Variant A/B/C (add/remove). Per Manual Section 7.5, always run 2–3 in parallel.
- Landing page URL.
- **72-hour review criteria** — colour-coded boxes:
 - Green "Continue if" — cost/reg under ₦X, ≥ N regs, CTR above X%.
 - Amber "Pause if" — cost/reg over ₦X, engagement below X%.
 - Red "Kill if" — total spend reaches ₦X with zero regs, or reputational issue surfaces.

💡 Once MD approves a brief, tick the checkbox and set the approval date. The exported Markdown then shows `[x] Yes – DD Month YYYY` at the top — keep that record for accountability.

4.8 Broadcast Brief (Appendix D — for Juan)

Like the Friday Report, this brief is one-per-week. Pick a week using prev/next at the top.

For each broadcast (you can add multiple per week):

- Day to send + time to send (WAT) + channel (WhatsApp / SMS / Both).
- Target list (NPS prospects / RRP corporate / Techno Summer parents / Doing Business / Canton Fair / Other).
- Estimated reach.
- **Message content** — paste the full message. **Live character counter** warns if you exceed the 1,000-char WhatsApp limit or 160-char SMS limit.
- Link to use, attachments.

Bottom of the form: **Lists to maintain** checklist — tick each list as "current" for the week, with optional note. This goes in the export so Juan knows which lists to verify.

💡 The character counter goes red when over-limit. SMS at 161 chars sends as TWO messages on most carriers — easy to miss and easy to overspend on.

5. Push notifications

Once enabled (gold banner on the Dashboard), you'll receive OS-level notifications for:

Trigger	When
Morning production block	Mon–Fri 8:45 AM WAT (15 min before 9 AM)
11 AM engagement reminder	Mon–Fri 10:45 AM
4 PM engagement reminder	Mon–Fri 3:45 PM
5 PM end-of-day reminder	Mon–Fri 4:45 PM
Monday calendar build	Mon 8 AM

Trigger	When
Wednesday GA4 deep-dive	Wed 9 AM
Friday report 3-hour warning	Fri 1 PM
Friday report submit	Fri 3:45 PM
Phase deadline	24 hours before a phase-bound milestone is due
Overdue alert	When a task's time passes without being checked off

Notifications click through to the relevant page (Tasks, Calendar, Friday Report, etc.).

6. Common workflows — step-by-step

Briefing Leo on a piece of design

1. From the Content Calendar week view, identify a cell where you ticked **"Needs design from Leo"**.
2. Go to **Creative Brief** → **+ New**.
3. Project title: name it clearly (e.g. "NPS 2026 — Phase 2 Keynote Speaker Reveal Carousel").
4. Deliverables: one per line. Be specific about dimensions:
 - 1× LinkedIn portrait post (1080×1350px)
 - 5× Instagram carousel slides (1080×1080px)
 - 1× X header (1500×500px)
5. Audience: who sees it and what they're doing when they see it.
6. Core message: the one sentence the design must communicate.
7. Mandatory elements: tick all that apply, add Other.
8. Mood/tone: three words. Two reference links.
9. First draft + final delivery dates: respect the Monday-brief-for- Wednesday-delivery rule from the Manual.
10. **Save** → **Download .md** → **send to Leo**. Or **Copy Markdown** and paste into Slack/WhatsApp.

Launching a paid ad (Phase 2 onwards)

1. **Paid Ad Brief** → **+ New**. Fill in every field — gaps mean Meta will ask weird questions later.
2. Run 2–3 copy variants in parallel (per Manual Section 7.5).
3. **Mark "Approved by MD" only after explicit written sign-off**.
4. **Save** → **Download .md** → **send to MD for approval**. When she replies "approved", tick the checkbox, save again, set the approval date.
5. Once approved: Go to **Metrics** → **Paid campaigns** → **+ New campaign**. Create a campaign record matching the brief.
6. In Meta Ads Manager / LinkedIn Ads, build the actual ad using your brief as reference.
7. **Daily** (Phase 2/3): **Metrics** → **Paid** → **Daily metrics** → log yesterday's spend, registrations, impressions, clicks. Cost/reg computes automatically.
8. **At 72 hours**: open the brief, read your continue/pause/kill criteria, compare to the dashboard's daily metrics. Pause variants that don't meet "continue if" criteria.

Submitting the Friday report

1. **9 AM Friday:** open **Metrics** → **Platforms**. Enter final weekly numbers for each of the 5 platforms.
2. **9 AM Friday: Metrics** → **Registrations & GA4**. Enter Thursday and Friday's running totals.
3. **9 AM Friday:** if running paid, **Metrics** → **Paid campaigns** → **Daily metrics** for each active campaign.
4. **10 AM Friday:** open **Friday Report** → **This week**. Verify the numbers summary at the top matches what you entered.
5. **Fill free-text sections.** Headline first — lead with whether you're ahead/on/behind.
6. **Watch the right pane preview.** That's exactly what gets sent.
7. **Save draft.** Now you can step away.
8. **Before 1 PM:** you'll get a push notification — "3 hours to the Friday report."
9. **Before 4 PM:** click **Mark as submitted** → **Download .md** → email to MD + Mary, Cc Favour/Leo/Juan as relevant items dictate.

Capturing GA4 numbers

1. Open GA4 in another tab → Reports → Acquisition → Traffic Acquisition.
2. Set the date range to "Last 7 days" (or the current week).
3. Note: total visitors to the registration page, conversion rate (events ÷ users), and the source breakdown.
4. Back to dashboard: **Metrics** → **Registrations & GA4** → **today's row**.
5. Enter page visits, conversion rate, top traffic source. Save.

7. Tips & best practices

- **The Today/Overdue panel is your truth-teller.** If it's empty before 5 PM Monday–Wednesday, you've planned the week. If it's full Friday afternoon, something slipped — note it in the report's "Blockers" section.
 - **Edit on blur saves automatically.** Type a number into the platform metrics grid, click anywhere else, the number is saved. No "Save" button to forget.
 - **Brief Leo on Monday, never Tuesday.** The Manual is very clear: Monday-brief-for-Wednesday-delivery, not the other way around. The Creative Brief module doesn't enforce this — *you* enforce it.
 - **Save brief templates.** Once you've made a great Creative Brief for a speaker reveal, the next speaker reveal can clone it. Right now the dashboard requires you to type fresh; one of the suggested enhancements below would automate this.
 - **Use the Markdown preview as a sanity check.** If the preview looks weird or has empty — placeholders everywhere, the brief isn't ready to send.
 - **The 72-hour rule is real.** Don't kill an ad at 48 hours. Don't keep one alive at 96 hours that's already failed your "continue if" criteria.
 - **Friday push notifications are the safety net.** Even if you're deep in a Canva session, 1 PM Friday will pull you out and remind you the report deadline is 3 hours away.
-

8. Customising the dashboard

Things you can change yourself in the Supabase dashboard (no code edits required):

Adjust the 200-target / 10,000 audience numbers

```
update profiles
  set nps_target = 250, audience_target = 12000
  where user_id = (select id from auth.users limit 1);
```

Add a custom recurring task

```
insert into tasks
  (user_id, title, description, category, recurrence_type,
   days_of_week, time_of_day_wat, reminder_lead_minutes,
   notification_trigger, start_date, end_date)
values
  ((select id from auth.users limit 1),
   'Daily Twitter scroll',
   'Spend 20 minutes scrolling X for Nigerian retirement-adjacent commentary',
   'custom', 'daily',
   null, time '10:00', 15, 'task_reminder',
   current_date, date '2026-08-31');
```

Edit a phase boundary date

```
update campaign_phases
  set start_date = date '2026-06-10', end_date = date '2026-07-08'
  where phase_number = 2;
```

Reset everything for a fresh start

(Nuclear option — wipes data, keeps schema)

```
truncate
  task_completions, content_calendar_entries,
  platform_metrics, paid_campaign_metrics, paid_campaigns,
  registrations_cumulative, creative_briefs, ad_briefs,
  broadcast_briefs, reports, notification_sends
cascade;
```

Add a new platform to the list

This requires a code edit. In `src/lib/types.ts` find the `PLATFORMS` constant and add an entry. You'll also need to extend the `platform_kind` enum in Postgres — ask me when you reach that point.

9. Suggested edits & future enhancements

In rough order of usefulness:

1. **Brief templates.** Save a brief as a "template" you can clone. Common templates: Speaker reveal, Phase 2 carousel, Friday recap, Event live coverage.
2. **AI Prompt Library** (per Manual Section 8). A new page that stores the 6 prompt templates from the manual + ones you've refined, one-click copy to clipboard.
3. **Engagement log.** A small form somewhere on the Dashboard to jot down meaningful comments / DMs / handshakes — the kind of thing that produces a Friday report "Win" three weeks later.
4. **Win log.** Like the engagement log but for posts that exceeded expectations — what worked, why, replicate.
5. **Speaker spotlight tab.** A dedicated section for managing speaker reveals — name, bio, headshot upload (Storage bucket already exists), reveal date, post status across all 5 platforms.
6. **Pre-event content capture plan.** Specific to event week — what photos, what videos, what quotes to capture. Brief Leo.
7. **Buffer integration.** OAuth into Buffer and pull post-performance data automatically into Platform Metrics instead of typing it.
8. **Dark mode.** A toggle in TopBar for late-night content sessions.
9. **PDF export of Friday report.** Currently exports as `.md`. PDF would be a nice-to-have for archiving.
10. **Multi-week metrics charts.** A small line chart on the Dashboard showing cumulative registration trajectory vs. the milestone ladder.
11. **Notification preferences.** Per-task setting to mute / change lead time. Right now they're hardcoded in the SQL seed.
12. **Audit log.** Show who-changed-what-and-when (useful when you eventually onboard a second person).

If any of these catch your eye, tell me which and I'll build it.

10. Content suggestions, drawn from the Manual

These are post ideas that align with the Operating Manual's strategy. Drop them into your Content Calendar as starting points.

Phase 1 — Awareness (mid-May to early June)

- "The three dimensions of retirement transition" — financial / identity / relational. One LinkedIn long-form per dimension, repackaged as Instagram carousels and an X thread.
- Eugenia's founder voice video — "What if retirement is your next big break?". Anchor video, then pull 30-second clips per platform.
- Nigerian retirement statistics — use Claude (Manual Section 8.3) to source three credible numbers, verify, post weekly.
- "Five speakers we're announcing this month" — gradual reveal cadence.

Phase 2 — Conversion (early June to early July)

- One speaker reveal per week, treated as a hero post on every platform.
- Agenda breakdowns — "Day 1 morning" / "Day 2 afternoon" carousels.
- Past attendee testimonials, if you can source them.
- Partner spotlights when NLC / BPSR / MDAs commit.
- Every third post in this phase ends with the direct registration CTA.

Phase 3 — Urgency (early July to 16 July)

- Countdown content — "X days until NPS 2026", daily, every platform.
- "Final 100 seats" / "Registration closes Friday" messaging.
- Short speaker-direct videos: "I look forward to seeing you on 15 July."
- Sponsor and partner cross-promotion shoutouts.

Event week

- Live LinkedIn / X posts during sessions.
- Instagram Stories for visual moments.
- Day 2 testimonial captures — 30-second video interviews.
- Within 24 hours of close: thank-you post with key statistics.
- Within 7 days: long-form LinkedIn recap, photo galleries, video highlights.

11. Troubleshooting

Push notifications don't arrive

1. **Check the Push Permission status:** Dashboard → if you see the gold banner, you haven't enabled push yet. If not, push *should* be on.
2. **Check the browser:** F12 → Application → Service Workers — confirm `sw.js` is registered and "activated".
3. **Check the subscription:** Supabase SQL Editor:

```
select count(*) from push_subscriptions where active = true;
```

If 0, the subscription was dropped. Re-enable in the browser.

4. **Check the function logs:** Supabase → Edge Functions → notify → Logs. Look for errors.
5. **Check the cron is firing:**

```
select start_time, status, return_message
from cron.job_run_details
where jobid = (select jobid from cron.job where jobname='noha-notify')
order by start_time desc limit 10;
```

6. **Check your system clock.** Push timing depends on your laptop's clock being accurate. Settings → Time & Language → Sync now.

Data isn't loading on a page

1. **Hard refresh:** Ctrl+Shift+R. Vite sometimes serves stale modules.
2. **Restart dev server:** Ctrl+C in terminal, `npm run dev` again. Required after `.env` changes.
3. **Check browser console (F12 → Console)** for red errors. Common one: "Missing VITE_SUPABASE_URL" → `.env` not loading.
4. **Check Network tab → filter "supabase"** → click any failed request → look at the response. 401/403 = key issue. 4xx = constraint issue.

5. **Check the raw data in Supabase Table Editor** — if it's there, it's a frontend issue. If not, your insert failed.

Tasks check off but don't show as completed

This was the "timestamp format mismatch + unstable query key" bug we fixed. If it returns: the completion is in the DB but the UI lookup is finding nothing. Check the latest `task_completions` row's `scheduled_for` format against what the frontend is computing — they must match via `new Date(...).getTime()`.

Friday report numbers look wrong

The report aggregates **the week's** metrics, where "the week" is Monday → Sunday in WAT. Common mistakes:

- You logged metrics under last Friday's date instead of this Monday's.
- You're looking at the wrong week — click "This week" to anchor.
- Cumulative registration jumped because you forgot to enter intermediate days — gaps in `registrations_cumulative` mean the weekly delta is computed against the latest prior row, not the start of the week.

"Unexpected response" error in notification_sends

VAPID mismatch — see the README under "If unexpected response still appears". Re-subscribe the browser with the current public key.

12. Glossary

Term	Meaning
Phase	One of the 4 cycle segments (Awareness, Conversion, Urgency, Post-event). Auto-detected by today's date.
Hero post	A major weekly post that gets adapted for all 5 platforms. Per manual, 2–3 per week.
Occurrence	A single instance of a recurring task — e.g., the 11 AM engagement window on Wednesday 14 May is one occurrence.
Cumulative registrations	Total NPS regs from day 1 of the cycle. Not weekly — running total.
Cost per registration (CPR)	Total paid ad spend ÷ registrations attributed to paid. Manual's target is under ₦5,000 in Phase 2.
72-hour rule	Per Manual Section 7.5. Don't judge a paid ad before 72 hours; do judge it at 72 hours.
VAPID	The cryptographic keypair Web Push uses to prove your app is the legitimate sender. Public half in browser, private half on the server.
WAT	West Africa Time, UTC+1 year-round (no daylight saving). Everything in this app is WAT for display, UTC in Postgres.

Term	Meaning
Service role key	The Supabase API key that bypasses Row-Level Security. Used locally so the dashboard works without a login screen. Never expose to a public deployment.

13. Converting this handbook to PDF

If you'd rather have a PDF copy:

1. **Easiest (VS Code):** Install the "**Markdown PDF**" extension by yzane. Open this file in VS Code → right-click → "Markdown PDF: Export (pdf)". Saved next to the source.
2. **Online (no install):** Go to <https://md2pdf.netlify.app> or <https://www.markdowntopdf.com> → paste the contents → download.
3. **Browser print:** Open this file in VS Code → click the preview icon top-right → Ctrl+P → "Save as PDF".

This handbook is a living document. As you find sections that don't match how you actually work, edit it — or tell me what to change and I'll edit it for you.

— Built with you, May 2026.
